CYB 400 - 4-2 Journal: Present Assessment Results

Instructor: Robert Chubbuck

If I were tasked with presenting the results of an IT assessment to senior leadership, my structured presentation would include a summary that highlights its purpose, key findings, and risk level in clear, non-technical terms. I would explain the scope and methodology to demonstrate credibility, then focus on the most critical findings, using visuals such as charts and heat maps to simplify technical information. Instead of using technical jargon, I would describe issues from a business perspective, such as financial loss, compliance risk, or damage to the organization's reputation.

To ensure that everything aligns with organizational goals, my presentation will prioritize recommendations that include clear steps, resource needs, and expected benefits. For example, upgrading outdated encryption protocols would not only improve security but also support compliance and customer trust in the long run. Moreover, I would keep the presentation concise, easy to understand, and use plain language, framing cybersecurity improvements as strategic investments that will help strengthen resilience and support long-term success and goals.
